This book constitutes the refereed proceedings of the 10th International Conference on Trust and Privacy in Digital Business, TrustBus 2013, held in Prague, Czech Republic, in August 2013 in conjunction with DEXA 2013. The 16 revised full papers presented were carefully reviewed and selected from numerous submissions. The papers are organized in the following topical sections: access control and authentication; identity and trust management; privacy and confidentiality management; information systems security; security policies/legal issues; and trust and privacy in mobile and pervasive environments.

This is the complete 2 volume set, containing both volumes one (ISBN: 9781599424910) and two (ISBN: 9781599425436) packaged together. The book provides a complete guide to the protocols that comprise the Internet Protocol Suite, more commonly referred to as TCP/IP. The work assumes no prior knowledge of TCP/IP and only a rudimentary understanding of LAN/WAN access methods. The book is split into a number of sections; the manner in which data is transported between systems, routing principles and protocols, applications and services, security, and Wide Area communications. Each section builds on the last in a tutorial manner and describes the protocols in detail so serving as a reference for students and networking professionals of all levels. Volume I - Data Delivery & Routing Section A: Introduction Section B: The Internet Protocol Section C: Reliable and Unreliable Data Delivery Section D: Quality of Service Section E: Routing Section F: Multicasting in IP Environments Section G: Appendices Volume 2 - Applications, Access & Data Security Section H: An Introduction to Applications & Security in the TCP/IP Suite

Debates about military influence on civilian government tend to be partisan and rarely pay sufficient attention to specific contexts. This paper analyses, without condemnation or justification, why and how the military exercises such influence in Turkey and whether it is likely to continue to do so. It argues that the role of the military in Turkey grows out of a specific Turkish context and is more a symptom than a cause of the country's flawed democracy. It examines the Turkish officer ethos, particularly the role of the indigenous ideology of Kemalism, and the broad, though not universal, public mandate for an interventionist role in politics. It contends that the military's influence is neither uniform nor total and that it is more effective at blocking than initiating policy; thus creating a system in which civilian authority is primary rather than supreme. It analyses the mechanisms through which the military attempts to shape policy, and demonstrates how its influence depends more on its informal authority than legislated rights or responsibilities. The paper suggests that fears of threats to national security resulting from the reforms required for EU accession have made the military more, not less, reluctant to withdraw from the political arena. It concludes that, regardless of the future of Turkey's

candidacy, such a withdrawal will be a slow and gradual process, dependent more on changes in Turkish social and political culture and the perceived security environment than in the military itself.

Developed from the authors' courses at Syracuse University and the U.S. Air Force Research Laboratory, *Access Control, Security, and Trust: A Logical Approach* equips readers with an access control logic they can use to specify and verify their security designs. Throughout the text, the authors use a single access control logic based on a simple propositional modal logic. The first part of the book presents the syntax and semantics of access control logic, basic access control concepts, and an introduction to confidentiality and integrity policies. The second section covers access control in networks, delegation, protocols, and the use of cryptography. In the third section, the authors focus on hardware and virtual machines. The final part discusses confidentiality, integrity, and role-based access control. Taking a logical, rigorous approach to access control, this book shows how logic is a useful tool for analyzing security designs and spelling out the conditions upon which access control decisions depend. It is designed for computer engineers and computer scientists who are responsible for designing, implementing, and verifying secure computer and information systems. This book demonstrates how FG MOS transistors can be used in a low-voltage and low-power design context. The techniques used provide innovative solutions, often in situations where the limits of technology in question have been pushed far below the values recommended by the manufacturer.

The final part deals with the social semantic web. Aspects covered include a broad survey of this emerging area; a description of a number of projects and experiences exploring semantic web technologies in social learning contexts; and a

new approach to collaborative filtering.

Drawing from current research in psychology, the social sciences, and spirituality, this book presents a comprehensive investigation into the heart of gratitude as it arises within lived experience and its role in nurturing relationships. It explores the range and depth of the emotion experience of gratitude and identifies its relationship with other indicators of wellbeing. New research by the authors reveals gratitude as a feature of transcendence and its connection to higher order experience including spirituality and religion. This book explores the potential for cultivating gratitude as a transformative practice for personal growth, enhancing relationships, and spiritual development.

This volume contains a selection of papers presented at the third European Computer Aided Systems Theory workshop, EUROCAST '93, held in Spain in February 1993. The workshop emphasizes interdisciplinarity with the specific goal of creating a synergy between fields such as systems theory, computer science, systems engineering and related areas. The contributions in this volume are strongly related to current problems in CAST research. They emphasize an engineering point of view concerning systems theory. Since the computer is an essential instrument in CAST research, there are close relations to specific topics in computer science. The papers are grouped into parts on systems theory and systems technology, specific methods, and applications. Develop a greater intuition for the proper use of cryptography. cryptographic algorithms in Python, demystifies cryptographic internals, and demonstrates common ways cryptography is used incorrectly. Cryptography is the lifeblood of the digital world's security infrastructure. From governments around the world to the average consumer, most communications are protected in some form or another by cryptography. These days, even Google searches are encrypted. Despite its ubiquity, cryptography is easy to misconfigure, misuse, and misunderstand. Developers building cryptographic operations into their applications are not typically experts in the subject, and may not fully grasp the implication of different algorithms, modes, and other parameters. The concepts in this book are largely taught by example, including incorrect uses of cryptography and how "bad" cryptography can be broken. By digging into the guts of cryptography, you can experience what works, what doesn't, and why. What You'll Learn Understand where cryptography is used, why, and how it gets misused Know what secure hashing is used for and its basic properties Get up to speed on algorithms and modes for block ciphers such as AES, and see how bad configurations break Use message integrity and/or digital signatures to protect messages Utilize modern symmetric ciphers such as AES-GCM and CHACHA Practice the basics of public key cryptography, including ECDSA signatures Discover how RSA encryption can be broken if insecure padding is used Employ TLS connections for secure communications Find out how certificates work and modern improvements such as certificate pinning and certificate transparency (CT) logs

Who This Book Is For IT administrators and software developers familiar with Python. Although readers may have some knowledge of cryptography, the book assumes that the reader is starting from scratch. With an emphasis on the challenges of sustaining the commons across local to global scales, *Making Commons Dynamic* examines the empirical basis of theorising the concepts of commonisation and decommonisation as a way to understand commons as a process and offers analytical directions for policy and practice that can potentially help maintain commons as commons in the future. Focusing on commonisation–decommonisation as an analytical framework useful to examine and respond to changes in the commons, the chapter contributions explore how natural resources are commonised and decommonised through the influence of multi-level internal and external drivers, and their implications for commons governance across disparate geographical and temporal contexts. It draws from a large number of geographically diverse empirical cases – 20 countries in North, South, and Central America and South- and South-East Asia. They involve a wide range of commons – related to fisheries, forests, grazing, wetlands, coastal-marine, rivers and dams, aquaculture, wildlife, tourism, groundwater, surface freshwater, mountains, small islands, social movements, and climate. The book is a transdisciplinary endeavour with contributions by scholars from geography, history, sociology, anthropology, political studies, planning, human ecology, cultural and applied ecology, environmental and development studies,

environmental science and technology, public policy, Indigenous/tribal studies, Latin American and Asian studies, and environmental change and governance, and authors representing the commons community, NGOs, and policy. Contributors include academics, community members, NGOs, practitioners, and policymakers. Therefore, commonisation–decommonisation lessons drawn from these chapters are well suited for contributing to the practice, policy, and theory of the commons, both locally and globally.

As science advances at breakneck speed, it becomes harder to make new discoveries and chart uncharted territory. Yet *The Deep Pull: A Major Advance in the Science of Ocean Tides* does just that. This book offers the world a new model of tide formation that can actually find a pattern in previously unintelligible tide data and be applied to both oceanic and atmospheric tides. At the heart of this new model is a new

theory on where lunisolar gravitational forces act. With this simple key, the author opens a new way of understanding a centuries-old science. Written for anyone with an interest in the mechanics behind natural phenomena, Walter Hayduk takes the readers through his thought process behind his new discovery. His accessible and engaging, step-by-step manner of uncovering a new paradigm through the exploration of data, analogies, and natural phenomena – from the Bay of Fundy's incredible tides to tornadoes – provides the reader with the excitement of his or her own eureka moment of understanding the secret of the tides.

Converging Social Justice Issues and Movements argues that multiple contemporary converging crises have significantly altered the context for and object of political contestations around agrarian, climate, environmental and food justice issues. This shift affects alliances, collaboration and conflict among and between state and social forces, as well as within and between social movements. The actual implications and mechanisms by which these changes are happening are, to a large extent, empirical questions that need careful investigation. The majority of the discussions in this volume are dedicated to the issue of responses to the crises both by capitalist forces and those adversely affected by the crises, and the implications of these for academic research and political activist work. Interdisciplinary in nature, Converging Social Justice Issues and Movements will be of great use to scholars of agrarian politics, as well as climate and environmental justice studies. The chapters were originally published as a special issue in *Third World Quarterly*.

At present, the marketplace for professionals, researchers, and graduate students in solid-state physics and materials science lacks a book that presents a comprehensive discussion of ferroelectrics and related materials in a form that is suitable for experimentalists and engineers. This book

proposes to present a wide coverage of domain-related issues concerning these materials. This coverage includes selected theoretical topics (which are covered in the existing literature) in addition to a plethora of experimental data which occupies over half of the book. The book presents experimental findings and theoretical understanding of ferroic (non-magnetic) domains developed during the past 60 years. It addresses the situation by looking specifically at bulk crystals and thin films, with a particular focus on recently-developed microelectronic applications and methods for observations of domains with techniques such as scanning force microscopy, polarized light microscopy, scanning optical microscopy, electron microscopy, and surface decorating techniques. "Domains in Ferroic Crystals and Thin Films" covers a large area of material properties and effects connected with static and dynamic properties of domains, which are extremely relevant to materials referred to as ferroics. In other textbooks on solid state physics, one large group of ferroics is customarily covered: those in which magnetic properties play a dominant role. Numerous books are specifically devoted to magnetic ferroics and cover a wide spectrum of magnetic domain phenomena. In contrast, "Domains in Ferroic Crystals and Thin Films" concentrates on domain-related phenomena in nonmagnetic ferroics. These materials are still inadequately represented in solid state physics textbooks and monographs.

Eleventh Hour CISSP Study Guide serves as a guide for those who want to be information security professionals. The main job of an information security professional is to evaluate the risks involved in securing assets and to find ways to mitigate those risks. Information security jobs include firewall engineers, penetration testers, auditors, and the like. The book is composed of 10 domains of the Common Body of Knowledge. In each section, it defines each domain. The first domain provides information about risk analysis and mitigation, and it discusses security governance. The second domain discusses techniques of access control, which is the basis for all security disciplines. The third domain explains the concepts behind cryptography, which is a secure way of communicating that is understood only by certain recipients. Domain 5 discusses security system design, which is fundamental in operating the system and software security components. Domain 6 is one of the critical domains in the Common Body of Knowledge, the Business Continuity Planning and Disaster Recovery Planning. It is the final control against extreme events such as injury, loss of life, or failure of an organization. Domain 7, Domain 8 and Domain 9 discuss telecommunications and network security, application development security, and the operations domain, respectively. Domain 10 focuses on the major legal systems that provide a framework for determining laws about information system. Several works on multimedia storage appear in literature today, but very little if any, have been devoted to handling long duration video retrieval, over large scale networks. Distributed retrieval of multimedia documents, especially the long duration documents, is an imperative step in rendering high-quality, high-fidelity, and cost-effective services for network service providers. Distributed Multimedia Retrieval Strategies for Large Scale Networked Systems presents an up-to-date research status in the domain of distributed video retrieval. This professional book will include several different techniques that are in place for long duration video retrieval. An experimentally tested technology under the JINI platform, demonstrates a practical working system which serves as a feasibility study, as well as the first step in realizing such a technology.

This volume is written for those who desire a comprehensive analysis of the latest developments in infrared detector technology and a basic insight into the fundamental processes which are important to evolving detection techniques. Each of the most salient infrared detector types is treated in detail by authors who are recognized as leading authorities in the specific areas addressed. In order to concentrate on pertinent aspects of the present state of the detector art and the unique point of view of each author, extensive tutorials of a background nature are avoided in the text but are readily available to the reader through the many references given. The volume opens with a broad-brush introduction to the various types of infrared detectors that

have evolved since Sir William Herschel's discovery of infrared radiation 175 years ago. The second chapter presents an overall perspective of the infrared detector art and serves as the cohesive cement for the more in-depth presentation of subsequent chapters. Those detector types which, for one reason or other have not attained wide use today, are also discussed in Chapter 2. The more notable and widely used infrared detectors can be divided into three basic classes which are indicative of the primary effect produced by the photon-detector interaction, i.e., thermal, photoconductive, photo voltaic, and photoemissive. Chapters 3, 4, and 5 offer a detailed treatment of each of these important processes.

Under the rule of Recep Tayyip Erdogan Turkey has descended into a dictatorship, promotes the Islamist agenda, abuses human rights, limits freedom of expression in the press, and wages war against the Kurds. While Turkey has historically been important geopolitically, it has become an outlier in Europe and an uncertain ally of the United States. An Uncertain Ally is a straightforward indictment of Erdogan. Drawing on inside sources in his Justice and Development Party (AKP) and the police, the book reveals corruption and money laundering schemes that benefitted Erdogan, his cronies, and family members. Erdogan has polarized Turkish society and created conditions that led to the coup attempt of July 2016. He has also deepened divisions by accusing Fethullah Gulen, an Islamic teacher in Pennsylvania, of establishing a parallel state and masterminding the coup attempt. Erdogan has seized on the failed coup to justify a witch hunt, arresting thousands and ordering the wholesale

dismissal of alleged coup sympathizers. Rather than foster reconciliation, he pursued vendettas and turned Turkey into a gulag. An Uncertain Ally exposes Turkey's ties to jihadists in Syria and the Islamic State, questioning its suitability as a NATO member. Under Erdogan, Turkey faces a dark future that poses a danger to the region and internationally.

presentation at SEC 2009. In response to the call for papers, 176 papers were submitted to the conference. All of them were evaluated on the basis of their novelty and technical quality, and reviewed by at least two members of the conference Program Committee. Of the papers submitted, 39 were selected for presentation at the conference; the acceptance rate was as low as 22%, thus making the conference a highly competitive forum. It is the commitment of several people that makes international conferences possible. That also holds true for SEC 2009. The list of people who volunteered their time and energy to help is really long.
